

Supplementary Figure 3. Likelihood ratios across functional-classification methods and control sets.

Abnormal-class (red) and normal-class (blue) likelihood ratios with log-Wald 95% confidence intervals for each functional-classification method (GMM score cutoffs, Waters, Tejura) applied to each control set: ClinVar pathogenic/likely-pathogenic vs benign/likely-benign (2025 and February 2026 releases; all variants and missense only), the KURIS/NDD vs benign/likely-benign missense set, and the Waters *et al.* validation sets. Shaded bands denote ACMG evidence-strength tiers.
